I changed the primary keys of the two parent tables. I removed the rdcaccount_id field because I don't really need it in the primary key. Now everything works fine, just as you explained. I get the data of the parent table in PopUp2, too. Exactly the way I want.
But there is one question left. One of the fields that I get from the parent table for popUp2 has subtype 'image'. In the PopUp2 screen I only see the image file path. Where can I change the field specs for that field to show me the image?
