This is outside the scope of the RBAC system as it requires the ability to update the database without first logging on. In also requires additional subscription details which are not held on the RBAC database.

As it is a single function which relates to a particular end-user application it should be written as an application function and not automatically provided by the framework. You will need to provide a screen on your website which can be run by anyone (i.e. does not check that the current page is authorised to the current user). It may then update the MNU_USER table as well your subscription info table.

You can still use the Radicore database table classes to access the database, but you will need a different presentation layer. This is documented in Using Radicore components in a front-end website.
