There is no screen shot, so I cannot see anything. You have given me the dict file for table 'orga_mannschaften_kontakte' and say that the popup data is being provided from table 'orga_vereine', but I cannot see any relationship between these two tables.

The whole purpose of a popup is to provide values from a record which you have selected from another table, and these values are provided in $select_array. By default these values will be copied into $fieldarray, thus overwriting those fields with the same names. If you don't want any values to be overwritten then you must remove them from $select_array before you exit from _cm_popupReturn().
