Within the condition "if ($GLOBALS['mode'] == 'list' || $GLOBALS['mode'] == 'read' || $GLOBALS['mode'] == 'search') {" you are manually inserting the column 'usuarioturnocaja' into the field specifications for the 'detalleventa' table, and the framework qualifies the column with that table name because it thinks that the column exists within that table. Try adding the property 'nondb' = 'y' and the framework will ignore that entry and not qualify the column name with the wrong table name.
