Issue #1 is easy to resolve. That script was only used to reformat the previous database structure into the present format, so it is now redundant and can be removed. File tcpdf_php4.php is also redundant and can be removed.

Issue #2 with datamatrix.php, qrcode.php and tcpdf_filter.php (and others) is a problem with the tcpdf library, so is out of my control.

Issue #3 can be ignored as both alias.class.inc and default.class.inc are nothing but templates used to build real class files.
