I can handle it now. Thank you.

But `$filename = basename($filepath)` returns only the name of the picture without the 'picker_subdir'. I do now extend `$filename` with the value of 'picker_subdir' (pictures/training_uebungen/) manually hardcoded. Even storing the value of 'picker_subdir' in `$GLOBALS['picker_subdir'] = 'pictures/training_uebungen'` doesn't work. When retrieving it in `_cm_popUpReturn()` it is empty.

Is there a possibility to get the value of 'picker_subdir'?
