I have split this post into a separate thread as the subject matter is different from that of the original thread.

If you wish to make multiple selections from a database table which you then wish to add into the database using the current task then I'm afraid that this can ONLY be done using a popup. Remember that a popup task will allow you to make multiple selections which can be processed in one go instead of single selections which have to be processed one at a time.

Navigation buttons cannot be used to make selections, they simple run another task, and after the popup task has terminated all the calling task can do is refresh itself.

You haven't really identified what you are trying to do and how you would like it done. If you say that when you define a team for a new season that most of the members are the same, so you don't want to start with an empty team then the solution is obvious - start by copying all the team's members from the previous season into the new one, then make changes by adding or removing individual members.
