Thank you for your proposed solutions. The way I wanted it to be done is the way I know. This doesn't mean that this is a good way. But I thought that it would be logical if you can choose and insert desired records into a child table.

If you say that I should copy all members of a team into the new team of the next season, this would be a good solution for me. But I don't know how to do this.

Is it right that I first have to create the new team, then select the team with the members to be inserted? And do I have to do this with an add4 pattern?

Or do I have to select all the team members which I want to insert in the new team and then choose the new team? And with which pattern?

Or do you think of a complete different way?
