I copied the code of your working example ('Update (fckeditor) - x_person_s03.class.inc) into my task and changed the field name from 'fckeditor_text' to 'bericht_text' in \$code. But the Javascript toolbar and the textarea aren't shown in the screen.

In the html source code is only the line: `<div class="main"><table></table></div>` without the `<colgroup>` specifications and the table rows as in your example.

I copied the javascript directory from xample to my subdirectory (htm).

Do I have to change somewhere a configuration setting? Or do I have to build the javascript directory from scratch?
