If we don't create another screen for a different Rule means we have to resort to coding in the classes. I don't see other way. Of course ideal case is based on Roles with no complex Rules.

Question is of course, how do developer find those code if business rules begins to pile up? Would they have to over analyse the source code in order to change certain functionality if application is huge?

Take for example (Simple):
1. When Contact status = 'Prospect'. All fields editable.
2. When Contact status = 'Customer'. All fields readonly except for phone number, fax numbers.

A more complex one
1. When a Loan status = 'Prospecting'. All fields editable. Collateral fieldNot Displayed.
2. When a Loan status = 'In Progress'. All fields editable Collateral field Displayed.
3. When a Loan status = 'Approved'. All fields read only. Loan Status field readonly. Collateral field Displayed.
