You are confusing me. You start with a LIST2 screen which has two tables, OUTER and INNER. It contains one occurrence of the OUTER table and multiple occurrences of the INNER table. When you press the navigation button which activates the OUTPUT3 task it passes down two variables - $where and $selection. $where will contain the primary key (or its foreign key equivalent) of OUTER while selection will contain the primary keys of any of the INNER rows which were marked as selected. In your OUTPUT3 task what is the starting table? What additional tables are you accessing in the _cm_output_multi() method?
