Hi Tony,

I have a strange behavior in one of my del1 pattern. There is always an exception saying that there is a unknown database. I attached the errorlog.htm. I checked the tables in dict (dict\_table, dict\_table\_key, dict\_column, dict\_related\_column). The fields, the relationships and the key are fine. It is just this pattern of this table. I used to have this behavior and after I exported the tables in php again, everything worked fine again.

Have you any idea where I can look for my fault?
