I have tried this task on my system and I cannot reproduce this error.

That stack trace points to line #985 in file includes/include.session.inc which is the call to session_start() BEFORE the lines you quoted. This should mean that it would fail for *ALL* calls to session_start() and not just the one within this particular task.

After reading the session data from the database PHP automatically calls unserialize() to turn it from a string into an array, but it appears to be failing for some unknown reason. Can you provide a copy of the first 80 bytes of that session data record?
