In line 1745 of std.pdf.class.inc there is the code: $after2 = $dbobject->_cm_ListView_print_after($current_row, $next_row);

In my custom method _cm_ListView_print_after() is $current_row an array with the values of the last record. $next_row isn't an array. It is a boolean variable with value false.

Do I have to change $next_row in _cm_ListView_print_after()? And if yes, how can I do this? Because the return value is $output.
