I need to display a new window with statistical graphs in my application, my idea is to place a button which when clicking open the new window, this window would receive as parameters the subset of data that is displayed on screen at the time to click the button.
I'm a little lost on how to open the window from radicore, I would like to know specifically what transaction could use and where would be the best place to locate the calling code to the new window.
Thanks for advance!

By default all the transactions produce output which is either HTML (via an XSL stylesheet), PDF or CSV. If you which to produce output which cannot be constructed using one of these methods then you will have to create a custom transaction which uses your own custom controller and your own output method. You will then have complete control over the way the data is displayed.

If by clicking on the button you want to run a different transaction then you can do so either by using the standard mechanism for navigation buttons, or take a look at FAQ137. If you wish to do this via a javascript popup then you will need to consult someone who knows javascript.
