hello again!,

I have an external site and want to use this framework to know the status of my processes.

I researched and I think I can use the webservice(SOAP) for this.

I created a workflow with this framework and validated.

The problem is that through my webservice returns parameters to workflow_engine.class.inc file, but I can not use the object
Â $ dbcase or $ this-> getData_raw ($ where)

How to use a webservice to create a case and track with this framework.

please this is what I really want to do.

Any tutorial or if you could please explain how to do it.

Thank you very much!

My workflow engine is designed to be used with an application developed using Radicore as it requires access to both the WORKFLOW database and the MENU database. Each transition in a workflow equates to a transaction in the MENU database. The contents of each transaction is irrelevant to the workflow system - it can do things with a local database, or it can use web services.
