An application which is built USING the Radicore framework can only run UNDER the Radicore framework. This is because any application code which you create makes extensive use of all the pre-written code which exists within the framework (functions, controllers, abstract table class, validation class, database driver classes, etc). It is not possible to run such an application WITHOUT the Radicore components.

That is the whole point of this framework, to provide you with an extensive library of pre-written code which you do not have to write yourself. You cannot remove this library of pre-written code and still expect your application to run.

Ok. This point is now clear. I suppose the framework does not have to be visible to end-users. How to make the only new subsystem visible without have access to menu subsystem ?

That is easy. All users must belong to a role, and each role can have its own start task (see [http://www.tonymarston.net/php-mysql/menuguide/mnu_role\(upd\) .html](http://www.tonymarston.net/php-mysql/menuguide/mnu_role(upd) .html))

All you have to do is set this start task to your application's own menu and this will bypass all the other menus for users of this role.

That is, indeed !
Thks.
