Hi!

I'm dumb enough to fail at startup.

I have downloaded the package and unzipped at c:\wamp\www\radicore

I have a clean MySQL server with NO database at all.

Created a sample database called "school" and granted privileges to user "tony" with password "tony".

But the error... doesn't mean anything to me.

Any ideas?

Can I have a sample and clean startup guideline clear enough for a dumb like me?

TIA

Jose

That error message is quite specific: Access denied for user 'tony'@'localhost'

As well as creating a user you need to grant that user access to all relevant databases. You need to study the MySQL Manual.

BTW you should NOT be using the user name and password supplied in my sample config file. You should create your own and amend the config file accordingly.
