Subject: File Picker - File name changing

Hi Tony,

is it possible to change the picked file name in the way: 'picked file name' = 'rdcaccount_id' . 'picked file name'? And is it also possible to filter according to these criterias? I search for a possibility to store uploaded files in a virtual private database so that each account-user can only see his own or the shared files.

Once you have used a file picker to identify the name of a file on disk it passes that name to your program, and you can do what you like with it. If you are adding that file name to a database table which contains a column called "rdcaccount_id" then that is handled in the application code and has nothing to do with the file picker.

I changed the $uploadfile in the way I wanted. Now each file which will be uploaded by a user i.e. in account no 4 has the following name: '000004_' . $_FILES['userfile']['name'].
I now will change the file listing in the same way so that each user can only see the files uploaded by a user in a shared account ('1') or by a user in his own account.
I think, this is important in a virtual private database. And it is the only way I see for me to deal with this problem.
