This function was always returning an empty string for me.
On line 943 I added the following code and it seems to be working properly now.

```
} else {
    // field is not duplicated, so copy to output array
    if ($last_separator) {
        $array_out[] = $last_separator;
        $last_separator = null;
    } // if
    $array_out[] = $fieldname .$operator .$fieldvalue;
} // if
```

Can you give me a example of your two input strings? I would like to check your input with the current version of this function which has changed slightly.

$where1 = "some_id='13'"
$where2 = "start_date <= '2007-06-21' AND end_date > '2007-06-21'"

You are right. There was a problem with that version, but it has been fixed in the upcoming version 1.25.0 which will be released shortly.
