Sorry,

I install PHP scripts which you sent me, but everything is same. Now I see that program corrupt just before db connect in mysqli.inc script. I tested and found that the contents, just before db connect, of dbprefix is 'test_' (not empty), USER_ERROR = 256. I install properly all of four PHP scripts. Three of them I put in includes which is under /var in /var/radicor_lib/ver_133/... and forth in www/RealTimeERP/dict below.

Whoops! I tested the changes I made to dml.mysql.class.inc and copied them to dml(mysqli).class.inc, but the latter required an additional change, which I have now made.

Try the attached files and let me know if they fix your problem.

Thank you, now everything is O.K.

I will test it late today, and confirm you. Now I make a plan how to organise test and production environment for my first Radicore PILOT project. Because of that this concept with dbprefix was important for me.
