Process was fairly easy with once exception.

After I had copied all the html into custom.detail1.xsl the spacing of the website had been pushed off entirely.

After a day and a half of trying to fix the spacing I finally stumbled across the issue.

All the website <img> tags in the original site were not terminated properly, and this cause xslt parse errors. So I went through and changed them to be <img ... />

This apparently causes FF and IE6 (not sure about IE7 or Safari) to implicitly add a newline after the image, and thusly throw off the spacing of the webpage.

Solution is to add style="display: block" to the img tag and it show fix the spacing.

I found the solution here:

Hoping this will help someone avoid the same time waste that I went through

out how to fix the spacing. And the more I hate myself when the solution is as simple as adding style="display: block" to the img tag. Huh! That's life indeed...continuous learning and searching will show us the way. Another point is that experiences must always be shared to help others. Bless you cpscdave!
