Subject: LIST3 - no paging area for "middle" as of 2.10

Greetings,

I noticed that since upgrading to 2.10 the paging area for the "middle" entity is no longer displayed. That problem did not occur in 2.09. I attach two screenshots, one from 2.09 and one from 2.10. The application is the same. Any ideas?

Whoops! That was a mistake in the stylesheet. Please replace your copy with the fixed version which is attached.

Thanks that works.
Re LIST3, what I always wanted to implement is:
On my LIST3 view I'd like the children/middle displayed to be the one I selected on a previous LIST2 view, instead of always start with the first record. What would be the best approach to implement this?

I'm afraid the current design does not support what you want. When you press a navigation button in one form in order to call another the items which you selected in the first form become the WHERE criteria in the outer entity/main of the second form.

Instead of having a LIST3 then I would go for another LIST2 where the outer entity shows the child from the previous LIST2, then has a JOIN up to its parent, thus combining two entities into a single zone.
