Hi Tony,
I wanted to show pictures in a separate screen very large so you can see details better. But I only can make a size of about 100x100 in the screen structure file. If I make it larger, the picture is in the next line visible. See attached screenshot.
A video subtype is displayed in the right size.
What do I have to do to get this big size shown correctly?

After playing around I eventually fixed this by changing the picker-image tag from a to a . All the changed scripts are in the attached zip file.
