After calling the PopUp3 pattern and after choosing an occurence there is no reaction in the _cm_popupReturn() method. Only the choose null option is handled. Is this correct or do I have to do something else?

It works as advertised on my PC. Can you step through with your debugger to see what is happening?

I stepped through the code after pressing as well the choose as the choose null button but I don't know where exactly I shall look for. In my _cm functions I cannot see an error. Can you tell me in which functions the chosen value should be visible that I can track it until there?

After pressing the CHOOSE button in a popup form the calling script is reactivated, and it should call the popupReturn() method which in turn should call the _cm_popupReturn() method.

Rather than trying to look in a particular place you need to activate your debugger and step through the execution of the script line by line from the very start until you see where and why it jumps over the call to _cm_popupReturn().

I found my fault. I forgot the key values in the $this->sql_select statement in the _read_CTE_default method in the tree class.inc. The tree structure was displayed properly without these pkey fields.
Now it works fine just as you said.
