I found out that when importing this table to radicore and exporting to php:

```
CREATE TABLE IF NOT EXISTS `programa` (  
  `programa_id` integer NOT NULL AUTO_INCREMENT,  
  `entidad_id` integer NOT NULL ,  
  `nombre` varchar(30) NOT NULL default "",  
  
  PRIMARY KEY (`programa_id`),  
  UNIQUE KEY (`entidad_id`,`nombre`),  
  unique (`programa_id`)  
) TYPE=MyISAM;
```

the .dict.inc file generated includes this code which gives an error:

```
$this->unique_keys[]          = array(  
                               'nombre');
```

Yes, this is a bug - fix attached.

BTW, declaring 'programa_id' as both 'primary_key' and 'unique' is superfluous as a primay key is automatically unique.
