
Subject: Change the number of rows a list transaction displays

Hi Tony,

I want to be able to change the number of rows displayed for a list1 transaction (actually, all transactions but I'm focusing on that for now) based on a session variable that I've implemented.

I've tried placing the session switch within the list1 transaction but that doesn't seem to work. It still displays the default 10 rows.

The following is the code in the list1 transaction:

```
// get pagination details
$pagination['main']['numrows'] = $dbobject->getNumRows();
$pagination['main']['curpage'] = $dbobject->getPageNo();
$pagination['main']['lastpage'] = $dbobject->getLastPage();

//Set rows per page to huge amount to remove pagination from offline mode
if (isset($_SESSION['standalone'])) {
    if ($_SESSION['standalone'] == true) {
        $dbobject->setRowsPerPage(20000);
        $pagination['main']['numrows'] = 20000;
        $pagination['main']['curpage'] = 1;
        $pagination['main']['lastpage'] = 1;
    }
}
```

the "// get pagination details" and the following expressions are written by you. Everything under that is done by me. The setRowsPerPage is not doing what I need it to do. Should I be trying to do this in another section? Thanks for you help.

If you read <http://www.tonymarston.net/php-mysql/dialog-types.html#navigation-bar> that the ability to change the page size of any 'list' screen is already built in to the framework. The default is 10 lines, but you can switch to 25, 50 or 100.

There are 2 reasons why I do not use a value greater than 100:

Anything above 100 lines per page would make the page too large for most users. The amount of time taken for the XSL transformation to execute on that amount of data would exceed max_execution_time.

Your proposed limit of 20,000 lines per page is far too large, and I have no plans to either implement or support it.
