Tony,

In the documentation you provide an example, using `_cm_ListView_pre_print()` to produce line breaks. Is it possible to do something similar to produce a page break?

I'm afraid not.

You could try calling `$this->Header()` within your code at the appropriate place.

I'll give it a try and let you know how I get on.

I've just tried forcing a page break in my test system and discovered the following:

(1) The code you actually need in your table object is:

```
$this->pdf->AddPage();
```

(2) In order to populate `$this->pdf` you will need to update the `outputPDF_ListView()` method in `std.table.class.inc` as follows:

```
$pdf = new PDF_list($structure); <== existing line
```

\$this->pdf =& \$pdf; <== add this line

I will put this change in the next release.

Thanks Tony,

That works exactly as I needed.

Actually Tony - I realise I have fallen foul of a small problem:

I only want to force page breaks in one particular report. Now that I have put code in the table class to form page breaks on change of a value, all my reports based on that table class now perform the page breaks.

How can I access the name of the output task from within `_cm_ListView_pre_print` to be able to handle this?

The various options are described in FAQ49: How do you deal with task-specific behaviour?

Sorry yes - realised I knew the answer as soon as I posted!
