How can I do for debug the validateUpdate() function; it returns two errors when it run:

- fechageneracion[0]: Unknown value for 'type': {null}
- usuariogeneracion[0]: Unknown value for 'type': {null}

However, those two fields have these values during the execution of _cm_pre_updateRecord() function:

idlote='204' AND idtarifa='107' AND idsecuencia='1' AND idautorizacion='1' AND numerotickets='0000000010' AND fechacreacion='2009-07-03 11:07:28' AND fechaactualizacion IS NULL AND estado='1' AND autorizacionsri='1107100522' AND descripciontarifa='Platea Av. Quito - Cortesia' AND fechageneracion='2009-07-14 03:10:43' AND fechaimpresion IS NULL AND fechacontabilizacion IS NULL AND usuariogeneracion='MGR' AND usuarioimpresion IS NULL AND usuariocontabilizacion IS NULL AND idticketinicial IS NULL AND idticketfinal IS NULL AND avance IS NULL AND tickets_imprime='100'

The _cm_pre_updateRecord() does nothing, only executes an array2where for capture the field values on a text file. (results shown).
The fields are datetime and string.

Some suggestion to solve this problem???
Thanks for advice.

What do you have in the $this->fieldspec array for those two fields? Does it include a 'type' => 'string/numeric/date/time' value?

Thanks for your answer, I can see where are you going, I have manipulated the $this->fieldspec array.
I was thinking the problem was about null values in the fields with errors. The problem is solved now!!
