Subject: Use of \$this->skip\_validation Posted by gpatti on Thu, 06 Aug 2009 10:22:08 GMT View Forum Message <> Reply to Message

I am trying to update a record and skip the associated validation as per the documentation. However, I've found that \_cm\_post\_updateRecord() is being executed on line 4598 of std.table.class.inc even though \$this->skip\_validation is set.

Is this a bug or have I misunderstood the processing somewhere?

Graham

Unfortunately the documentation is slighty out of date as a call to \_cm\_post\_updateRecord() will still be made. This is because I came across a set of circumstances where I wanted to skip the validation but NOT the post-update processing.

If you want the code inside\_cm\_post\_updateRecord() to be ignored then you will have to test the contents of \$this->skip\_validation yourself.
