Hi all,

I have started to explore the abilities of RADICORE for less than 2 days.

In general I am completely happy with the user management system, but as I don't want to add all users manually, I would like to have a solution so that a non-user can apply/register for a user account at the login screen.

If another user approves this request, then the user is created and can login to the system.

I was thinking about using the IS\_DISABLED field in table USER for this functionality.

If the non-users clicks on register then an entry is created in the USER table with IS\_DISABLED=true.

In form List User I would add a button for "list disabled users".  
By clicking on select all I would enable these users.

If possible, I would also send an email to the user telling him, that he can start to work with the system.

I guess I am not the first one, who could need this function.

If you have experience in customizing radicore in this way, please tell me.

Thank You

Matthias

Hi all - No.2

By now, I have achieved to get a button  
List Disabled Users  
and this list works

From what I read in another thread, I should use MULTI1 or MULTI2 instead of LIST1.

Lets find out if that's doing the mass updates.

Nobody has ever asked for this functionality as the number of users who are allowed to access the system is generally quite small - just the members of staff who need to maintain the data - so the effort in manually entering the details of each user is also small.

The idea that unknown users can register themselves goes against Radicore's security philosophy, so I see no reason to implement such a feature.

Once you have a screen called 'List Disabled Users' I presume you want to select a number of entries, then press a navigation button to unset the 'is\_disabled' flag for each of these selected users. If you don't want this update task to have a visible screen then may I suggest the Update4 pattern.
