---

This version contains the following updates:

added TIMETABLE1 to the list of patterns in the menu database. You will need to import details from `radicore/menu/sql/menu.menu_export.sql`

changed several tasks in the Classroom Scheduling prototype to use the TIMETABLE1 pattern.

You will need to import details from `radicore/classroom/sql/crss.menu_export.sql`

added FILEDOWNLOAD to the list of patterns in the menu database. You will need to import details from `/radicore/menu/sql/menu.menu_export.sql`

added `person_filedownload.php` to demonstrate the FILEDOWNLOAD pattern. This can be accessed from the "Enquire Person" screen. You will need to import

`/radicore/xample/sql/xample.menu_export.sql` to load the definition for the new transaction.

fixed problem with the "Choose Schedule" option in the Classroom Scheduling prototype.

amended "Search Audit detail" screen so that the use of the FROM date/time and TO date/time fields is more logical.

changed `std.add1/2/3.inc` so that the contents of `$messages` is passed back to the previous script.

changed `std.multi3.inc` so that it does not read INNER if MIDDLE is empty.

changed `std.treenode.xsl` so that it encloses each icon with `<span class="icon">...</span>` which allows it to be given its own style attributes in the CSS file.

renamed column SURVEY\_DESC to SURVEY\_LONG\_NAME on SURVEY.SURVEY\_HDR table to be consistent, and changed column MIN\_VALUE on SURVEY.NUMBER\_OPTION to be required instead of optional. You will need to import

`radicore/survey/sql/mysql/alter_table(2006-07-16).sql` and

`radicore/survey/sql/survey.dict_export.sql`

changed `std.multi1.inc` to return to calling script if the call to `$object->getData()` returns an error.

amended "Update Menu Control Data" screen to include an option to keep all user passwords hidden.

changed column ARC\_TYPE on WORKFLOW.WF\_ARC so that default is 'SEQ' instead of 'NORMAL'. You will need to import `radicore/workflow/sql/mysql/alter_table(2006-07-19).sql` and `radicore/workflow/sql/workflow.dict_export.sql`

amended `include.session.inc`, `std.table.class.inc`, `std.list1/2.inc` to allow search criteria used in a parent screen to be passed down to a child screen. For example, screen A shows a list of customers, but only those customers who have orders which satisfy certain selection criteria. Screen B will usually show all orders for a selected customer, but if it is called from screen A it must only show those orders which satisfy the search criteria that was used in screen A. This search criteria is automatically made available to all inner objects in the standard `$where` argument.

fixed `include.xml.php4/5.inc` so that multiple attributes for the same column are grouped together.

changed `std.column_hdg.xsl` so that it can deal with `<col>` attributes of align, valign, char and style (as well as width and class) in the screen structure file.

changed all css files to remove all text-align and vertical-align specifications for table cells so as not to override what is specified in the screen structure file.

updated the dictionary details for the MENU database. You can import these details from `radicore/menu/sql/menu.dict_export.sql`

updated the dictionary details for the AUDIT database. You can import these details from  
radicore/audit/sql/audit.dict\_export.sql  
updated the dictionary details for the WORKFLOW database. You can import these details from  
radicore/workflow/sql/workflow.dict\_export.sql  
updated the dictionary details for the DICT database. You can import these details from  
radicore/dict/sql/dict.dict\_export.sql  
amended include.general.inc to reference either std.singleton.php4.inc or std.singleton.php5.inc  
as different code is needed for the different PHP versions.
