I just installed radcore on a wamp server to test it.

I created all databases and filled as per installation instructions, all seems ok and I can get the logon screen but there I am stuck...

I tried to log as demo, and all the users I can see on the mnu_user table from myphpadmin, which are quite a few...

even changing passwords to unscrambled ones to no avail...

I still get the "you must log to enter the system ..."

On the audit table I can see all records of all my trials to enter the system so it is doing its work somehow...

Can you point me to new ideas ??

I do not know if that may help but the default user I get after any failing is a user name I created as global user of mysql NOT listed on mnu_user table... why and how is radcore getting this logon values ??

Regards from Spain

What happens if you login as MGR?

The DEMO user only has access to the prototype applications, so have you installed them?

Yes, I installed all prototypes and its data but still can't log

Yes I also tried as MGR - password and still have the same message...

After browsing on the forum I also tried the cookies of my browser double checking they are allowed on Firefox and Chrome...

I even saw an old message that suggested changing mnu_control encrypt to N and created a new user on mnu_user with a plain text password...and tried to log on with this user too...

All leads to the same.... I can't log on and I do not get any error message only the green message saying that I must log before, etc...

Any ideas ??

The login screen is supposed to create an entry in the `$_SESSION` array before jumping to the next screen, but if the next screen cannot find this entry then it immediately jumps back to the login screen. If this entry is missing from the `$_SESSION` array it usually means that the entire array is empty as it is using a different session_id from what the login screen used. Your htaccess file should contain the following:

```
php_value session.use_cookies 1
php_value session.use_only_cookies 1
php_value session.use_trans_sid 0
```

Do you have a debugger installed? Can you see what the `$_SESSION` array contains when the menu.php screen fires up?

Thanks for your quick replies.... thumbs up to you !!

I'll try to investigate and give you all feedback with your ideas...

I do not have any debugger installed since the idea was to try on a local wamp server before going online.

the funny thing is that meanwhile I uploaded also installation to a shared server and it is working there exactly as expected !!

I thought it would be more complicated due to having a database prefix and giving permissions to all *nix files, etc...

so the mystery is still open, but I have a happy end ...

Cheers!!
